

The trip descriptions in the guidebook include many coordinates of strategic locations. These are expressed as Latitude and Longitude. The coordinates have been located in the moving map program OziExplorer and saved as a waypoint file (.wpt) and a .gpx file. The .wpt file can be used with the Hema Navigator HN7 and other units such as the VMS navigators. The .gpx file can be loaded into the Hema HX1 navigator and Garmin units.

The coordinates also include positions of caravan parks, camping areas, bush camps and many picnic areas statewide.

Further information about each location is included in the individual waypoint properties.

Over 600 waypoints are included in the files.
